Notice of Completion of Closure

Hoot Lake Plant Ash Landfill

Introduction

The purpose of this document is to comply with the notification and certification requirements for coal combustion residual (CCR) facility closure pursuant to 40 CFR Part 257.102(h) stating:

> *Within 30 days of completion of closure of the CCR unit, the owner or operator must prepare a notification of closure of a CCR unit. The notification must include the certification by a qualified professional engineer or the approval from the Participating State Director or the approval from EPA where EPA is the permitting authority as required by § 257.102(f)(3). The owner or operator has completed the notification when it has been placed in the facility's operating record as required by § 257.105(i)(8).*

Completion of Closure

During the summer of 2023, Otter Tail Power Company (Otter Tail) completed final closure of the CCR Ash Landfill located at Hoot Lake Plant at 1012 Water Plant Road in Fergus Falls, MN. Onsite construction activities were completed on September 20, 2023. A preliminary Notice of Completion of Closure was posted to the public website on October 16, 2023 while the Construction Documentation and Certification Report was under preparation and review.

The Construction Documentation and Certification Report, prepared by Carlson McCain, was submitted to the Minnesota Pollution Control Agency (MPCA) on November 20, 2023 and approved by the MPCA on January 25, 2024. The Construction Documentation and Certification Report is also attached to this notice.

Deed Notation § 257.102(i)

On January 10, 2024, Otter Tail recorded a notation on the property deed in accordance with § 257.102(i). The notation was also placed in the CCR operating record.

Commencement of Post Closure care Period § 257.104
In alignment with the MPCA's date for initiation of the state post-closure care period, the CCR 30-year post closure care period began on January 11, 2024.

Notifications
The following notifications and recordkeeping requirements required by the federal CCR Rule have been completed:

- § 257.102(h): Completion of a notification that the closure completion certification has been placed in the operating record.
- § 257.105(i)(8): Placement of the closure completion certification in the operating record.
- § 257.105(i)(9): Placement of the deed notation in the operating record.
- § 257.106(i)(8): Notification to the State Director that the closure completion report has been placed in the operating record.
- § 257.107(i)(8): Placement of the notification of closure completion certification on the CCR Rule Compliance Data and Information Website.

PE Certification § 257.102(f)(3)
I hereby certify that the final cover system of the Hoot Lake Plant CCR Landfill has been designed to meet the requirements of § 257.102(d)(3) and has been constructed in accordance with the written CCR Closure Plan. I certify that I am a duly licensed professional engineer under the laws of the State of Minnesota.

Dear Mr. Miller:

SUBJECT: OTTER TAIL POWER COMPANY
ELECTRONIC CONSTRUCTION CERTIFICATION REPORT FOR
HOOT LAKE PLANT INDUSTRIAL SOLID WASTE LANDFILL SW-211

Accompanying this letter is a pdf file containing an electronic copy of the construction certification report for the 2023 Cell 2 Final Closure construction project at the Otter Tail Power Company Hoot Lake Plant facility in Fergus Falls, MN. This project closed the last remaining open area of the landfill, and the facility no longer accepts waste. The report is submitted for your review and approval.

Otter Tail expects that upon approval of this construction documentation report, the facility will commence its post-closure care period. Once MPCA approves the enclosed report, Otter Tail will proceed with recording a notation on the property deed to include the landfill feature.

A hard copy or electronic copy on CD can be mailed to your attention upon request.

If you have any questions concerning the report, please contact me at (218) 739-8349.

Sincerely,

Paul Vukonich
Manager, Environmental Services

1.0 INTRODUCTION

This report presents the results of field observations and testing work performed during construction of the 2023 Final Closure Project (Project) at the Otter Tail Power (OTP) Hoot Lake Ash Landfill (Landfill). Approximately 3.75 acres of open area was capped on the Landfill over portions of the West Phase and Cell 2 to close the Landfill. The construction consisted of subgrade preparation, geomembrane liner installation, granular drainage material placement, borrow source excavation, rooting soil placement, topsoil placement, stormwater runoff control system construction, and turf establishment.

The following companies provided construction services to complete the Project:

Company	Activity or Products
Carlson McCain, Inc. (Carlson McCain)	Design, QA/QC
Veit & Company, Inc. (Veit)	Earthwork (Prime Contractor)
Global Containment Solutions, LLC. (GCS)	Geomembrane Installation (Subcontractor to Veit)
Skaps Industries, Inc. (Skaps)	Geomembrane Manufacturer
Soil Engineering Testing, Inc. (SET)	Soil Testing (Subcontractor to Carlson McCain)
Neaton Brothers Erosion, Inc. (Neaton Brothers)	Seeding and Turf Restoration (Subcontractor to Veit)

Final Cover construction began on June 26, 2023. Construction observation was performed by Carlson McCain during key activities of the project and consisted of observing and recording activities of the prime contractor and subcontractors, answering questions, and interpreting information contained in the Drawings and Specifications as requested by the contractor, and directing testing and quality control activities performed by independent testing firms and construction subcontractors. Full-time construction observation was performed for all final cover geomembrane installation.

Construction was performed in accordance with MPCA Permit No SW-211, and "Technical Specifications 2023 Final Cover Construction", prepared by Carlson McCain, Inc. dated January 2023. Deviations from the Technical Specifications and Drawings are noted on the enclosed Record Drawings and are described in the following sections of this report.

Notation of Final Closure of the Landfill will be made on the Deed for the property filed with Otter Tail County and will be submitted to the MPCA in an addendum to this report. Deed

Notation will include a Closure Record and construction documentation for the Landfill and carry the County Recorder's seal. The Closure Record shall detail an estimate of waste disposed in the Landfill, that the land has been used as a CCR unit, including other land use of the property, that land use is restricted under the post-closure care requirements as provided by Code of Federal Regulations § 254.104(d)(1)(iii), and a survey plat of the site prepared and certified by a land surveyor registered in Minnesota.

2.0 CONSTRUCTION MATERIALS AND METHODS

The following paragraphs provide general descriptions of materials and methods used during construction. Reference should be made to the Technical Specifications for more detailed information on the construction materials. Construction was completed as shown in the Construction Photographs in Appendix A and the Record Drawings in Appendix F.

2.1 Subgrade Preparation

To begin subgrade preparation for final cover construction, ash was excavated using an excavator and GPS dozer and was re-placed where fill was needed to achieve the permitted liner grades. Where ash was at liner grades, the ash was over-excavated at least 12 inches. Where additional fill was needed to reach liner grades, common fill was excavated from onsite borrow, hauled to the project area by off-road haul trucks, spread with a GPS dozer in 12-inch loose lifts, and compacted with a vibratory smooth drum roller. At least 12 inches of buffer soil was placed over all ash to protect the final cover geomembrane. At liner grades, rocks larger than 3 inches were removed by hand. The subgrade was then smoothed by back dragging with a skid-steer and rolled with a smooth-drum roller, providing a uniform surface prior to liner deployment.

An excavator exposed the edge of existing final cover geomembrane along the tie-in. A laborer worked with the excavator to remove the plywood markers used to protect and identify the edge of the existing geomembrane. The laborer hand-shoveled any remaining soils left on the existing geomembrane. The subgrade was then surveyed with GPS equipment to verify the subgrade was within tolerance of the permitted grades. The geomembrane installers inspected the subgrade prior to deployment of the geomembrane and confirmed the subgrade was acceptable by signing the Subgrade Acceptance Forms included in Appendix C. Subgrade preparation activities are shown in Photos 1 and 2 in Appendix A.

2.2 LLDPE Geomembrane Liner

Final cover liner was installed directly over the buffer layer and consisted of 40-mil textured linear-low density polyethylene (LLDPE) geomembrane. Geomembrane was manufactured by Skaps and was delivered to the site in 24-foot wide by 715-foot-long rolls. Manufacturer's quality control certificates for the geomembrane rolls are included in Appendix C. The rolls were inspected upon arrival to ensure the roll numbers matched the manufacturer's certifications and to verify they were not damaged.

Rolls were deployed using a skid-steer equipped with a spreader bar. The skid-steer either lifted the roll at the base of the Project Area then backed up to deploy the panels or sat on the top of the slope while the geomembrane was pulled downslope by hand by the liner crew. Laborers worked alongside the roll being deployed to align the panel, remove wrinkles, and secure the panels in-place with sandbags.

Deployment started on the south half of the project area, then progressed westward and then northward to cover all open area of the landfill. Adjacent LLDPE panels were seamed together

using a dual-wedge fusion welder whenever possible. Patches, seams, and boots that could not be wedge welded, were extrusion welded. One pipe penetration boot was installed on the final cover liner for the cleanout pipe located on the west side of the landfill.

The tie-in to existing final cover was wedge welded where practical. The final cover termination along the toe of the slope was extrusion welded to the existing primary 60-mil high density polyethylene (HDPE) base liner, as noted in the Record Drawings in Appendix F.

LLDPE geomembrane seam testing and quality control is discussed in Section 3.2. Panel orientation, panel number, seam, destruct, and repair locations are shown on the As-built Panel Layout Drawings in Appendix C. Geomembrane installation is shown in Photos 3 through 10 in the Construction Photo Log in Appendix A.

2.3 Granular Drainage Material

The drainage sand used for the final cover project was hauled in from offsite. Source and in-place material testing of the granular drainage material was conducted as described in Section 3.4 to confirm the material met project specifications. Testing showed the material had a few small, rounded rocks larger than 3/8-inch diameter. All granular drainage material passed the 1/2-inch sieve and greater than 99% of material passed the 3/8-inch sieve. Because this was a small deviation from specification, the rocks were rounded, and the final cover will not have additional pressure after construction, the material was approved for use by the Engineer.

Granular drainage material hauled to the site was stockpiled, then loaded into off-road trucks and dumped on the final cover area. Drainage material was placed in minimum 3-foot-thick lifts on haul roads utilized by trucks driving over the geomembrane. A dozer utilizing GPS equipment then spread the material over the geomembrane by rolling it off the edge of previously placed material in a single 1-foot-thick lift. Granular drainage material was spread upwards from the bottom of the final cover area to prevent wrinkling and damage to the geomembrane.

Granular drainage material thickness was verified using GPS survey equipment as described in Section 3.1. Additionally, thickness at random locations was checked by the spotter working alongside the dozer, who dug down to the geomembrane with a square-nosed shovel and measured the thickness of the placed layer. The drainage layer was fine-graded and verified to be within the specified thickness tolerance prior to placement of overlying layers.

To drain infiltrated stormwater over the final cover, 4-inch draintile with filter sock was also installed on top of the geomembrane along the toe of the stormwater berm and around the edges of final, as shown in the Record Drawings in Appendix F. Granular drainage layer placement is shown in Photos 11 and 12 in Appendix A.

2.4 Rooting Soil

After placement of the granular drainage material, rooting soil was placed on the final cover. Rooting soil was obtained from borrow on the southeast side of the Landfill and spread 1-foot thick by the dozer equipped with GPS. Rooting soil was placed thicker on the upper portion of

the cap to construct the stormwater berm, as shown in the Record Drawings in Appendix F. Thickness was verified as discussed in Section 3.1.

2.5 Site Restoration

Final cover topsoil was placed in a single lift following placement and thickness verification of the previous layers. There was not enough topsoil in stockpile onsite and in borrow to complete the project, so some topsoil was imported to the site. Imported topsoil was tested as described in Section 3.4.3. To place the topsoil for the final cover, material was pushed directly upslope or hauled onto the final cover with off-road tucks. After dumping the topsoil on the final cover area, a dozer utilizing GPS spread the material in a single 6-inch lift. Compaction of the topsoil layer was restricted to the least extent possible to place and grade the layer. Additional topsoil berms were placed on the north and south sides of the landfill to direct stormwater as shown in the Record Drawings in Appendix F. Final thickness verification was completed as described in Section 3.1.

Stabilization of all disturbed areas was completed by September 22, 2023. Site stabilization includes seeding with, dormant mixture, and fertilizer, dragging, and covering the soil with erosion control blanket or mulch according to the Specifications and Drawings. Erosion control blanket was installed on all slopes greater than 10% and was stapled in-place. Areas flatter than 10% grade were mulched. A stormwater ditch draining to the north and south of the landfill was covered with turfmat to prevent scouring. A road crossing as well as a rip rap plunge pool were placed on the south side of the stormwater ditch. The road crossing consisted of rock ballast from onsite rock sources, graded to drain across the landfill access road. The rip rap plunge pool consisted of MNDOT Class 3 rip rap underlain by 8-ounce non-woven geotextile and was installed at the base of the south ditch for energy dissipation.

Additionally, topsoil was placed over a depression on the top of the existing final cover to drain stormwater and additional area was seeded and blanketed on the north slope of the landfill where vegetation was sparse, as shown in the Record drawings in Appendix F. Information on seeding and stabilization measures is included in Appendix E. Topsoil placement and site restoration is shown in Photos 13 through 17 in Appendix A.

3.0 TESTING AND QUALITY CONTROL

Carlson McCain on-site personnel coordinated and observed testing and quality control activities performed by independent testing firms and subcontractor internal CQA technicians. Testing and quality control procedures and results are presented below.

3.1 Surveying and Material Thickness Verification

Calson McCain completed all survey and grade verification using GPS equipment. Earthwork verification surveying included survey shots at grade breaks and on a 100-foot grid on the liner subgrade, the top of granular drainage material layer, top of rooting soil layer, and at the finished grade (top of topsoil layer) within the Project area. Survey shots were repeated over the established grid points to verify material thicknesses. Construction staking was completed by the contractor, using their own GPS equipment and personnel to verify material thickness as needed.

Additional GPS survey shots were taken during final cover construction for as-built records. These survey shots included: berm breaklines, flowlines, and locations of restoration activities. Complete survey data is contained in Appendix B.

3.2 LLDPE Geomembrane Testing and Quality Control

All geomembrane installation was performed with construction oversight by a dedicated, CQA technician from GCS and an on-site field engineer from Carlson McCain. Construction testing and quality control activities for installation of the composite final cover liner included the following:

- reviewing panel/roll and resin certifications from the manufacturer
- inspecting and accepting of subgrade surface upon which composite liner was installed
- preparing and testing pre-seaming trial welds
- observing panel/roll deployment, placement/positioning, and seaming
- performing non-destructive testing of all seams
- performing destructive testing of seams
- observing and non-destructively testing patches and repairs

Prior to delivery of the LLDPE geomembrane to the site, the manufacturer submitted pre-certification documentation for properties of the rolls to be used on the Project, as required by the Specifications. The roll certifications are included in Appendix C. The subgrade was inspected and approved for installation of liner by GCS prior to deployment. The Subgrade Acceptance Form is included in Appendix C.

Pre-seaming trial seams were prepared at the beginning of each seaming period with each piece of seaming equipment by the corresponding operator. Generally, there were two seaming periods on each day that seaming was performed (morning and afternoon). One-inch-wide

coupons were cut out of the trial seams and tested on-site by the geomembrane installer, under observation by Carlson McCain personnel, for mechanical seam strength (shear and peel) using a calibrated tensiometer. All trial seams met the minimum required seam strengths of 60 pounds per inch (lbs/in) for shear and 50 lbs/in for peel of split-wedge-welded seams, and 60 lbs/in for shear and 44 lbs/in for peel of extrusion-welded seams. Trial seam tests are reported on the Trial Weld Forms included in Appendix C.

All seams were non-destructively tested for leaks using either the air-channel test for dual-wedge welded seams or the vacuum box test for extrusion welded seams. Non-destructive testing was completed until each seam achieved passing results; any leaks found through non-destructive testing were repaired and re-tested. Non-destructive testing is included on the Panel Seaming Forms and Repair Forms in Appendix C.

Destructive seam tests were performed on samples taken randomly from seams in the installed geomembrane. Carlson McCain marked destructive samples at a rate of one sample per 500 lineal feet of seam and walked over every seam of the final cover geomembrane. A total of 13 destructive seam samples were marked and tested. The destructive seam samples were tested on-site by the geomembrane installer, under observation by Carlson McCain personnel, for shear and peel strength using a calibrated tensiometer. All seam destructive testing passed in accordance with the Technical Specifications and results are recorded on the Destructive Testing Forms included in Appendix C.

Repairs at seam joints, seam burnouts, rips, tears, or other holes in the geomembrane were mended by extrusion welding a geomembrane patch or cap over damaged areas. Small punctures or manufacturer deformities in the geomembrane were repaired by placing an extrusion bead over damaged areas. All patches, caps, and beads were vacuum tested to verify that the repairs did not leak. Repairs to the geomembrane liner are noted on the As-built Panel Layout Drawing and Repair Forms included in Appendix C.

The 40-mil textured LLDPE geomembrane was installed and tested in conformance with the Technical Specifications. The geomembrane installer's As-built Panel Layout Drawing, Subgrade Acceptance Forms, Tensiometer Calibration Certificate, and Quality Control Reports are included in Appendix C.

3.3 Soil Testing

SET performed soil-testing activities on granular drainage material, and topsoil for the project. Granular drainage material testing included soil classification, grain size analysis, and permeability analysis. Topsoil testing included analyses of grain-size. Topsoil samples were also sent to the University of Minnesota Soils Testing Laboratory for organic matter, pH, and fertilizer recommendation.

3.3.1 Granular Drainage Material

Imported granular drainage material was tested at stockpile locations on-site and once placed throughout the duration of the project. Source and in-place sampling included hydraulic conductivity analysis to determine permeability and particle size analysis to determine maximum particle size, percent passing the No. 200 sieve, and uniformity coefficient for the drainage material. Approximately 7,000 cubic yards of granular drainage material was placed over the 3.75 acre project, requiring four source hydraulic conductivity tests (1 test per 2,000 cubic yards), two source particle size tests (1 test per 5,000 cubic yards), four source soil classification and descriptions (1 test per 2,000 cubic yards), four in-place hydraulic conductivity tests (1 test per acre), and four in-place particle size tests (1 test per acre) according to MPCA guidance. Samples were taken at the rates listed above, note four source particle size tests were taken (exceeding requirements) to obtain the required number of soil classifications and descriptions. All samples met the Specifications for minimum permeability of 1.0×10^{-2} centimeters per second, uniformity coefficient less than 6.0, and no more than 5% passing the No. 200 sieve. All samples had 100% passing the 1/2-inch sieve, but several samples did not meet the particle size requirement of 100% passing the 3/8-inch sieve. Greater than 99% of the granular drainage material passed the 3/8-inch sieve though, and the rocks retained on the 3/8-inch sieve were round in nature. Due to the low variance (less than 1% difference) from Specifications and round nature of the rocks, it was concluded the material would not harm the final cover geomembrane and was deemed acceptable by Carlson McCain for granular drainage material. Test results for granular drainage material are summarized in Table 1. Complete results are included in Appendix D for all granular drainage material testing.

3.3.2 Topsoil

Onsite topsoil has been shown to support vegetation, but because additional topsoil had to be imported for the project, the imported material was tested to determine suitability and fertilizer recommendations. Topsoil testing included analyses of particle size, organic matter, and pH, and was completed according to MPCA guidance; one test was completed per requirements for the source material for particle size and soil classification and description, while three tests were completed to fulfill the minimum requirement for nutrient testing. The material met requirements for particle size but did show pH slightly higher than the recommended range. Fertilizing was completed according to recommendations from the University of Minnesota Soils Testing Laboratory at a rate of 0 lbs Nitrogen, 40 lbs Phosphorous, and 40 lbs Potassium and the topsoil was determined to be capable to support plant growth, so the slightly higher pH was approved by Carlson McCain. Topsoil testing is summarized in Table 2 and test results are included in Appendix D.

4.0 CONCLUSION

Construction of the 2023 Final Closure Project at the OTP Hoot Lake Ash Landfill has been completed in material conformance with the "Technical Specifications 2023 Final Cover Construction", prepared by Carlson McCain, Inc. dated January 2023, and in compliance with the requirements for notification, construction, materials, and testing contained in MPCA Permit No. SW-211. Final Closure of the OTP Hoot Lake Ash Landfill (SW-211) has been completed in accordance with the Closure Plan dated September 18, 2017, with MN Administrative Rules § 7035.2635 and with Code of Federal Regulations § 257.102(f)(3).

Tensiometer Calibration Certificate

DEMTECH Services Inc.®

CALIBRATION CERTIFICATE

Tensiometer Model: Pro-Tester [T-0100/A or T-0100SE/A]

Device Calibrated: S-Type load cell

Range: 0 - 750 lbs. Tension

Model No: XTS2-750

Serial No: 266627

Calibration Apparatus: Pro-Cal unit, model TC-0100/A

A/D Module Model No: T-029

A/D Module Serial No: 3322266627

Channel No: N/A

Indicator reading with no load: 0

Dead Weight:		Reference Cell	
W1	2	R1	2
W2	152	R2	152
W3	302	R3	302

Offset: -6.332791 Scale: 3.327377

Applied Force lbs.	Cell Response:	Deviation Error:
2	2	0.00
52	52	0.00
102	102	0.00
152	152	0.00
202	202	0.00
252	252	0.00
302	302	0.00

Total Deviation Error (%): 0.00%

Temperature at time of calibration: 73 degrees F

Exitation Voltage: 5 V DC

This calibration conforms to the standards set by ASTM E4 and is traceable to NIST standards

Note: A/D Module and load cell above have been systems calibrated and are considered a matched pair. In general, calibrated A/D Modules and load cells are not interchangeable.

Comments

1. The recommended rates of P2O5 and/or K2O are to be broadcast and incorporated before seeding and top-dressed after the 1st cutting of the 1st year in production. Re-test field before the 2nd production year. If oats are seeded as a nurse crop, apply 30 lb. N/acre.
2. The recommended rates of P2O5 and/or K2O are to be top-dressed to the established stand. Re-test in two years.
3. For best results, the recommended rate of lime should be broadcast and incorporated from 6 to 12 months before seeding.
4. If only phosphorus is recommended for any agronomic crop and the recommendation is 30 lb./A or less, it may not be practical to broadcast this low rate. An alternative would be to double this suggested rate and broadcast on alternate years.
5. If only potash is recommended for any agronomic crop and the recommendation is 40lb./A or less, it may not be practical to broadcast this low rate. An alternative would be to double this suggested rate and broadcast on alternate years.
6. Broadcast phosphate will not increase yield at this P level. Use 10-15 lb. P205/acre in a starter.
7. No phosphate fertilizer is recommended, but, if the soil temperature is low and soils are wet, use 10-15 lb. P2O5/acre in a starter for corn.
8. This P level is very low. Use a combination of starter (drill applied for small grain) and broadcast applications. Subtract the rate for starter (drill) from the suggested broadcast rate. Use the starter (drill) rate and broadcast the remainder.
9. This K level is low. Use a combination of starter (drill applied for small grain) and broadcast applications. Subtract the rate for starter (drill) from the suggested broadcast rate. Use the starter (drill) rate and broadcast the remainder.
10. No broadcast potash is recommended. Suggested rate is 10-15 lb. K2O/acre in a starter fertilizer.
11. Use of a starter fertilizer (fertilize with the drill for small grains) is a good way to apply fertilizer at soil test levels where phosphate and/or potash are needed. Do no apply urea, thiosulfate, or boron in contact with the seed. Do not use more than 10-15 lb./acre of N + K2O in contact with the seed for small grain, or 8 lb./acre of N + K2O in contact with the seed for corn production.
12. The soil test for sulfur is appropriate only for coarse textured (sands, loamy sand, sandy loams) soils. Sulfur recommendations are made for sandy soils only. Use an annual application of 25 lb. S/acre for alfalfa and red clover. For corn and small grains use either a broadcast application of 25 lb. S/acre or a band application of 10-15 lb. S/acre. Use this recommendation if there was no soil test for S.
13. In Minnesota, research with agronomic crops has shown that boron (B) use has only been beneficial for alfalfa production on limited soils. Therefore, B is not recommended for other agronomic crops.
14. In Minnesota, use of iron (Fe), manganese (Mn), and copper (Cu) has not increased yield of this crop. Therefore, none is recommended. Use of zinc (Zn), where needed, may increase yield at the recommended rate listed.
15. Although no fertilizer N is recommended on this field, as based on the test result for nitrogen, a small amount of N applied in a starter fertilizer at planting is encouraged.
16. Research trials in Minnesota show that this crop will not respond to the use of micronutrients (Zn, Fe, Mn, Cu, B). Therefore, none are recommended.
17. If the small grain crop follows soybeans, subtact 20 lb. N/acre from the N recommendation listed.
18. Manure applications result in nutrient credits that should be subtracted from fertilizer needs. Proper nutrient crediting is discussed in bulletins: AG-FO-5879C, 5880C, 5881C, 5882C and 5883C available at your County Extension Office.
19. Do not place any fertilizer in contact with the soybean seed.
20. Do not apply more than 5.5 lb./acre of N + K20 in direct contact with the seed.
21. Subtract the NO3-N test result for the top 2 feet from the recommendation value to determine the amount of fertilizer N (lb./acre) to apply.
22. The soil ntitrate test can be used to predict fertilizer N needs in your area if samples are taken before planting in the spring. If the sample was collected at another time, the N recommendation listed is based on yield goal, previous crop, and organic matter content. See Bulletin 3790 B (revised) for more details.
23. The recommended N rate shown should be used if barley is grown for malting purposes. If barley is used for feed, increase rate by 10 percent (multiply by 1.1).
24. Lime recommendations are reported as lbs. of ENP per acre (Effective Neutralizing Power). To determine the tons of lime needed to be applied per acre, divide the ENP recommendation by the "ENP PER TON" value provided by your liming material dealer.
25. No nitrogen is recommended because of NO3-N carryover.

Purpose:	General non-native roadside for dry or sandy soils.				
Planting Area:	Statewide. Well suited for Pine Moraines & Outwash Plains, Mille Lacs Uplands, and Anoka Sand Plain subsections. Mn/DOT Distrct 3A and eastern 3B				

Erosion Control Blanket Data

ERO-GUARD

MATERIALS DATA SHEET:

Product Name: EG- 2sRD
Manufacturer: Ero-Guard, Inc.
Contact: Brian F Dingels (612) 382-2783

Physical Description:

Size: Available in 16' and 8' widths and 112.5' and 562.5' lengths (Custom cuts are available upon request).

Plastic: 2 layers (Top and Bottom) of .5" x .5" opening, lightweight photodegradable polypropylene plastic. EG-2sRD also has a UV degrader added to it to break down the plastic at a more rapid rate.

Thread: 420 denier degradable split yarn, with a UV degrader added to it to match its longevity with that of the plastic.

Matrix: 100% weed free agricultural straw, .50 lbs/yd^2

Packaging: All rolls are wrapped tightly with stretch wrap to protect the rolled erosion control product from the weather and elements.

Longevity: The Functional Longevity is approximately 60-90 days depending on sunlight, moisture and environmental conditions.

Recommended Applications: EG-2sRD is recommended for use on slopes up to 3:1 and in low flow channels.

Recommended Installation pattern: The leading edge is to be trenched into a 6" deep trench and the blanket is to be placed parallel to the anticipated water flow. When more than 1 blanket is required, they are to be overlapped 6" on all overlapping sides and tiled in a shingle type pattern as to not let the water underneath the blanket.

Turf Mat Data

American Excelsior Company®
Earth Science Division

Proud Participant in NTPEP and Proud Member of:

PRODUCT DATA SHEET
TRINET® RECYCLEX®

DESCRIPTION

TriNet Recyclex, a three dimensional permanent non-degradable Turf Reinforcement Mat (TRM), consists of 100% post-consumer recycled polyester (green bottles) with 80% five-inch fibers or greater fiber length. It is of consistent thickness with fibers evenly distributed throughout the entire area of the TRM. The top, middle, and bottom of each TRM is stitched together with ultra heavy duty UV stabilized polypropylene nets. Fibers are tightly crimped and curled to allow fiber interlock, and to retain 95% memory of the original shape after loading by hydraulic events. Fibers have a specific gravity greater than 1.0; therefore, the blanket will not float during hydraulic events. TriNet Recyclex TRM meets Federal Government Executive Order initiatives for use of products made from, or incorporating, recycled materials. TriNet Recyclex TRM shall be manufactured in the U.S.A. and the fibers shall be made from 100% recycled post-consumer goods.

TriNet Recyclex TRM has a design soil loss ratio (event-based RUSLE C factor) of .015 and is typically suitable for slopes up to .5H:1V. TriNet Recyclex TRM is rated for channel flows up to 25.0 ft/s (7.62 m/s) and 14 lb/ft² (670 Pa) shear stress.

PHYSICAL PROPERTIES

TriNet Recyclex TRM measurements at time of manufacturing:

Width		8.0 ft (2.4 m)	16 ft (4.9 m)
Length		67.5 ft (20.6 m)	67.5 ft (20.6 m)
Area		60.0 yd² (50.2 m²)	120 yd² (100.34 m²)
Weight		68.9 lb (31.25 kg)	137.8 lb (62.5 kg)
Fiber Length (80% min.)		≥ 5.0 in (≥ 12.7 cm)	≥ 5.0 in (≥ 12.7 cm)
Recyclex Matrix (± 10%)		0.500 lb/yd² (0.271 kg/m²)	0.500 lb/yd² (0.271 kg/m²)
Product Weight (± 10%)		1.148 lb/yd² (0.623 kg/m²)	1.148 lb/yd² (0.623 kg/m²)

TURF REINFORCEMENT MAT
SPECIFICATION

PART I - GENERAL

1.01 Summary

A. The Turf Reinforcement Mat (TRM) contains post-consumer recycled polyester fiber for the purpose of erosion control and revegetation as described herein.

B. This work shall consist of furnishing and installing the TRM; including fine grading, installing TRM, stapling, and miscellaneous related work, in accordance with these standard specifications and at the locations identified on drawings or designated by the owner's representative. This work shall include all necessary materials, labor, supervision, and equipment for installation of a complete system.

C. All work of this section shall be performed in accordance with the conditions and requirements of the contract documents.

D. The TRM shall be used to prevent surface erosion and enhance revegetation. Based on a project-by-project engineering analysis, the TRM shall be suitable for the following applications:

1. Slope protection
2. Channel and ditch linings
3. Reservoir embankments and spillways
4. Culvert inlets and outfalls
5. Dikes, levees, and riverbanks

1.02 Performance Requirements

A. TRM shall provide a permanent cover material to reduce slope and/or channel erosion and enhance revegetation.

B. TRM performance requirements:

Slopes[a]:	≤ .5H:1V (ASTM D6459)
C factor[a]:	.015 (ASTM D6459)
Shear Stress[a]:	14.0 lb/ft^2 (670 Pa) (ASTM D6460)
Velocity[a]:	25.0 ft/sec (7.62 m/sec) (ASTM D6460)
Functional Longevity:	Permanent

[a] Slope and channel performance ratings are based on typical industry values.

1.03 Submittals

A. Submittals shall include complete design data, Product Data Sheets, Product Netting Information, SDS, Staple Pattern Guides, Installation Guidelines, Manufacturing Material Specifications, Manufacturing Certifications, CAD details, and a Manufacturing Quality Control Program. In addition, the Manufacturer shall provide a test report providing data showing the performance capabilities of the TRM along with reference installations similar in size and scope to that specified for the project.

1.04 Delivery, Storage, and Handling

A. TRM shall be furnished in rolls and wrapped with suitable material to protect against moisture intrusion and extended ultraviolet exposure prior to placement.

B. TRM shall be of consistent thickness with fibers distributed evenly over the entire area of the TRM.

C. TRM shall be free of defects and voids that would interfere with proper installation or impair performance.

D. TRM shall be stored by the Contractor in a manner that protects them from damage by construction activities.

PART II - PRODUCTS

2.01 Turf Reinforcement Mat

A. TRM shall be TriNet Recyclex, as manufactured by American Excelsior Company, Arlington, TX (1-866-9FIBERS).

B. TriNet Recyclex, a three dimensional non-degradable Turf Reinforcement Mat, consists of 100% post-consumer recycled polyester (green bottles) with 80% of fibers ≥ 5 inches in length. It is of consistent thickness with fibers evenly distributed throughout the entire area of the TRM. The top, middle, and bottom of each TRM shall be covered with ultra-heavy duty polypropylene UV stabilized black netting. Fibers shall be tightly crimped and curled to allow fiber interlock and to retain 95% memory of the original shape after loading by hydraulic events. Fibers shall have a specific gravity of greater than 1.0; therefore, the TRM will not float during hydraulic events. TriNet Recyclex shall meet Federal Government Executive Order initiatives for use of products made from, or incorporating, recycled goods. TriNet Recyclex shall be manufactured in the U.S.A. and the fibers shall be made from 100% recycled post-consumer goods.

C. TRM shall have the following material characteristics:

Width		8.0 ft (2.4 m)	16 ft (4.9 m)
Length		67.5 ft (20.6 m)	67.5 ft (20.6 m)
Area		60.0 yd^2 (50.2 m^2)	120.0 yd^2 (100.34 m^2)
Weight		68.9 lb (31.25 kg)	137.8 lb (62.5 kg)
Fiber Length (80% min.)		≥ 5.0 in (≥ 12.7 cm)	≥ 5.0 in (≥ 12.7 cm)
Recyclex Matrix (± 10%)		0.500 lb/yd^2 (0.271 kg/m^2)	0.500 lb/yd^2 (0.271 kg/m^2)
Product Weight (± 10%)		1.148 lb/yd^2 (0.623 kg/m^2)	1.148 lb/yd^2 (0.623 kg/m^2)
Net Openings	Top - Ultra Heavy Duty Polypropylene (UV-Stabilized)	0.45 in x 0.58 in (11.43 mm x 14.73 mm)	0.45 in x 0.58 in (11.43 mm x 14.73 mm)
	Middle - Ultra Heavy Duty Polypropylene (UV-Stabilized)	0.45 in x 0.58 in (11.43 mm x 14.73 mm)	0.45 in x 0.58 in (11.43 mm x 14.73 mm)
	Bottom - Ultra Heavy Duty Polypropylene (UV-Stabilized)	0.45 in x 0.58 in (11.43 mm x 14.73 mm)	0.45 in x 0.58 in (11.43 mm x 14.73 mm)

TYPICAL INDEX VALUES

Index Property	Test Method	Value
Thickness	ASTM D 6525	0.529 in (13.44 mm)
Light Penetration	ASTM D 6567	26.7%
Resiliency	ASTM D 6524	83%
Mass per Unit Area	ASTM D 6566	1.204 lb/yd^2 (0.653 kg/m^2)
MD-Tensile Strength Max.	ASTM D 6818	1000.0 lb/ft (14.59 kN/m)
TD-Tensile Strength Max.	ASTM D 6818	900.0 lb/ft (13.13 kN/m)
MD-Elongation	ASTM D 6818	20.0%
TD-Elongation	ASTM D 6818	19.5%
UV Stability	ASTM D 4355 (1,000 hr)	90% minimum
Porosity	Calculated	96.63%
Stiffness	ASTM D6575	2.62 oz-in
Bench-Scale Rain Splash	ASTM D 7101	SLR = 45.66 @ 2 in/hr [b,c]
Bench-Scale Rain Splash	ASTM D 7101	SLR = 16.45 @ 4 in/hr [b,c]
Bench-Scale Rain Splash	ASTM D 7101	SLR = 12.12 @ 6 in/hr [b,c]
Bench-Scale Shear	ASTM D 7207	4.3 lb/ft2 @ 0.5 in soil loss [c]
Germination Improvement	ASTM D 7322	311%

[b] SLR is the Soil Loss Ratio, as reported by NTPEP/AASHTO. [c] Bench-scale index values should not be used for design purposes.

2.02 Staples

A. Staples shall be U-shaped, 11 gauge steel wire and shall be 1 inch wide by 6 inches long, or 2 inches wide by 8 inches long.

PART III - EXECUTION

3.01 TRM Supplier Representation

A. Contractor shall coordinate with the TRM supplier for a qualified representative to be present at the job site on the start of installation to provide technical assistance as needed. Contractor shall remain solely responsible for the quality of installation.

3.02 Site Preparation

A. Before placing TRM, the Contractor shall certify that the subgrade has been properly compacted, graded smooth, has no depressions, voids, soft or uncompacted areas, is free from obstructions such as tree roots, protruding stones or other foreign matter, and is seeded and fertilized according to project specifications. The Contractor shall not proceed until all unsatisfactory conditions have been remedied. By beginning construction, Contractor signifies that the preceding work is in conformance with this specification.

B. Contractor shall fine grade the subgrade by hand dressing where necessary to remove local deviations.

C. No vehicular traffic shall be permitted directly on the TRM.

NOTE: Topsoiling, seeding, and fertilizing is not included in this specification.

3.03 Slope Installation

A. TRM shall be installed as directed by the owner's representative in accordance with manufacturer's Installation Guidelines, Staple Pattern Guides, and CAD details. The extent of TRM shall be as shown on the project drawings.

B. TRM shall be orientated in vertical strips and anchored with staples, as identified in the Staple Pattern Guide. Adjacent strips shall be overlapped to allow for installation of a common row of staples that anchor through the nettings of both TRMs. Horizontal joints between TRMs shall be sufficiently overlapped with the uphill end on top for a common row of staples so that the staples anchor through the nettings of both TRMs.

C. Where exposed to overland sheet flow, a trench shall be located at the uphill termination. TRM shall be stapled to the bottom of the trench. The trench shall be backfilled and compacted. Where feasible, the uphill end of the TRM shall be extended three feet over the crest of the slope.

D. Slope TRM shall be overlapped by the channel TRM sufficiently for a common row of staples to anchor through the nettings of both products when terminating into a channel.

3.04 Channel Installation

A. TRM shall be installed as directed by the owner's representative in accordance to manufacturer's Installation Guidelines, Staple Pattern Guides, and CAD details. The extent of TRM shall be as shown on the project drawings.

B. TRM shall be installed parallel to the flow of water. The first roll shall be centered longitudinally in mid-channel and anchored with staples as identified in the Staple Pattern Guide. Subsequent rolls shall follow from channel center outward and be overlapped to allow installation of a common row of staples so that the staples anchor through the nettings of both TRMs.

C. Successive lengths of TRM shall be overlapped sufficiently for a common row of staples with the upstream end on top. Staple the overlap across the end of each of the overlapping lengths so that staples anchor through the nettings of both TRMs.

D. A termination trench shall be located at the upstream termination. TRM shall be stapled to the bottom of the trench. The trench shall be backfilled and compacted.

3.05 Quality Assurance

A. TRM shall not be defective or damaged. Damaged or defective materials shall be replaced at no additional cost to the owner.

B. Product shall be manufactured in accordance to a documented Quality Control Program. At a minimum, the following procedures and documentation shall be provided upon request:
   1. Manufacturing Quality Control Program Manual
   2. First piece inspection of products produced to assure component materials and finished product tolerances are within manufacturer specifications.
   3. Additional inspections for product conformance shall be conducted during the run after the first piece inspection.
   4. Every roll shall be visually inspected.
   5. Additional inspections for product conformance shall be conducted during the run after the first piece inspection.
   6. At a minimum, every third roll shall be weighed to insure conformance of manufacturers specifications.
   7. Each individual erosion control blanket shall be inspected prior to packaging for conformance to manufacturing specifications.

3.06 Clean-up

A. At the completion of this scope of work, Contractor shall remove from the job site and properly dispose of all remaining debris, waste materials, excess materials, and equipment required of or created by Contractor. Disposal of waste materials shall be solely the responsibility of Contractor and shall be done in accordance with applicable waste disposal regulations.

3.07 Method of Measurement

A. The TRM shall be measured by the square yard of surface area covered. No measurement for payment shall be made for overlaps, fine grading, trenching, staples, or other miscellaneous materials necessary for placement of the erosion control TRM.

3.08 Basis of Payment

A. The accepted quantities of TRM shall be paid for at the contract unit price per square yard, complete in place.

Payment shall be made under:

Pay Item	Pay Unit
Turf Reinforcement Mat	Square Yards

Subject: Otter Tail Power Co (SW-211) - Final Cover Construction Certification Report

Good afternoon Paul,

The Minnesota Pollution Control Agency (MPCA) has received the following documentation for final closure of Otter Tail Power Company Hoot Lake Ash Landfill (SW-211):

- Final Closure Construction Certification Report dated November 17, 2023 and submitted to the MPCA on November 20, 2023; and
- Recorded Deed Notation dated and submitted January 11, 2024.

The MPCA has reviewed the documentation for compliance with Minn. R. 7035.2610, Minn. R. 7035.2635, and other applicable rules and permit conditions. The MPCA finds that the closure documentation provided in the Final Closure Construction Certification is substantially complete and approves the construction for final closure.

Additionally, the MPCA recommends that the facility mark the edge of waste with signs or posts so that is it clear for any future use and maintenance work.

The Postclosure Care Period officially begins as of January 11, 2024, per this approval. The MPCA will draft the Closure Document and provide that to you for review when complete.

Thank you,

Joseph Miller
